CHARACTER
PLOT

On-chain

Off-chain

Use Cases

- Automated Escrow Accounts for buying used cars
- SC managed home purchases including title & escrow
- SC capable of sending texts
- Venture rounds and kickstarters
- *SC embedded insurance markets*
- *Full Load*

Oracles…not so wise!

- Forcing distributed architecture on a centralized world
- Inherently suspicious of off-chain information and entities
- Platform focus on reliable and secure message passing

Key Hypothesis

In addition to reliable and secure message passing, Identity transposition is key to solving the problem of combining smart contracts with off-chain trusted third party services (TTPs)

Proposed Solution

Distributed architecture implementing Shamir’s Shared Secrets to shard identity information — only customer’s Smart Folio in possession of the identity pair

On-Chain
